

Today I will be presenting my Cs 391 Final Project, my stance is

Software developers are NOT 100% ethically responsible for the software they create and how it is used. To give a brief roadmap of the argument, first we will look at the software in question, what is being used and how, what are we arguing for and what are we avoiding, that will be expanded on when we get there. Next focusing on the question at hand, are developers responsible, this will focus on intent from developers vs. interpretation of consumers and ultimately argue why developers aren't fully responsible. following that, if developers aren't responsible, then who is? Lastly to close a brief slide of work cited to create this presentation.
